

To fix hard drive error you need to run the DOS command CHKDSK. This command scans your selected drive for disk errors and file errors and automatically fixes the error. To maintain an error-free hard drive you need to defragment the drive regularly.

To fix hard drive error you will need to start your computer in DOS command prompt. You can do this by either using your Windows installation disk and going into the Repair console

You can also access the DOS command prompt by pressing F8 at Windows startup, but after the BIOS.

You can also carry out Windows error-check on any of your drives after within Windows, click [here](#) for instructions

Next to maintain your hard drive and keep it error-free carry out a hard drive defragment, click [here](#) for instructions
